Growing Up in a Bad Neighborhood Does More Harm Than We Thought

Share full article

51

Residents outside their apartments at the Robert Taylor Homes in Chicago in 1980. A study showed that children who were forced out of public housing went on to have annual earnings that were 16 percent higher than those who remained, and they were 9 percent more likely to be employed. Charles Osgood for The New York Times

- Children raised in disadvantaged neighborhoods (Chyn and Katz, 2021; Katz, 2026)
 - attain less education
 - earn less
 - experience lower social mobility

What Tearing Down Housing Projects Did for Kids

Bringing rich and poor together has major benefits.

By Idrees Kahloon

Antonio Dickey / Getty

- **Social environment** as a distinct input into children's outcomes (Jackson, 2026)

- changes in childhood communities track changes in mobility (Chetty et al., 2026)
- public-housing redevelopment helps by connecting residents to surrounding networks (Chetty et al., 2026)

Challenge: neighborhoods bundle material conditions with a social environment

Neighborhoods shape children's human capital, which carries into adult occupation and income

(Chetty et al., 2016; Chyn and Katz, 2021)

Challenge: neighborhoods bundle material conditions with a social environment

Neighborhoods shape children's human capital, which carries into adult occupation and income

(Chetty et al., 2016; Chyn and Katz, 2021)

Challenge: neighborhoods bundle material conditions with a social environment

Neighborhoods bundle **material conditions** with a **social environment**

- material: schools, housing, amenities, transport access, etc.
- social: who lives nearby, trust, mutual help, etc.

Challenge: neighborhoods bundle material conditions with a social environment

Neighborhoods **shape** education through both channels

Challenge: neighborhoods bundle material conditions with a social environment

Most causal evidence moves families: both channels change at once

(Kling et al., 2007; Chetty et al., 2016; Chyn, 2018; Chetty et al., 2026)

Research question

Can a neighborhood's social environment reduce households' educational investment?

Research question

Can a neighborhood's social environment reduce households' educational investment?

Research question

Can a neighborhood's social environment reduce households' educational investment?

The social environment can also respond to education

Research question

Can a neighborhood's social environment reduce households' educational investment?

Research question

Can a neighborhood's social environment reduce households' educational investment?

Neighborhood orientation: the extent to which social interactions, trust, and mutual assistance are concentrated among people who live in the neighborhood rather than elsewhere.

This paper I: Persistent human capital gaps where provision converged

- **Historical natural experiment in neighborhood formation: Guadalajara, Mexico**

This paper I: Persistent human capital gaps where provision converged

- **Historical natural experiment in neighborhood formation: Guadalajara, Mexico**
 - a creek split the new city (1542): conquerors west, the conquered population east
 - unsettled site, $\approx$ geography, same jurisdiction
 - **exclusion: east** $\downarrow$ **status and** $\downarrow$ **public provision**

The three foundational settlements, 1542

This paper I: Persistent human capital gaps where provision converged

Roadmap of the talk

Introduction

Context and Historical Natural Experiment

Persistent Neighborhood Effects on Educational Outcomes

Exclusion and Persistent Neighborhood Differences

Neighborhood Orientation and Educational Demand

Neighborhood Orientation Beyond Guadalajara

Conclusion

Context and Historical Natural Experiment

Guadalajara, 1542: colonial status assigned by side of a creek

Years of schooling by census block, 2020

- Mexico's second-largest metropolitan area
- Rich and schooled: 11.0 years of schooling vs. 9.7 nationally
- Attendance, ages 12–17: most variance lies *within* municipalities
79% between households, 4% between municipalities

Guadalajara, 1542: colonial status assigned by side of a creek

- Founded on unurbanized land, in one administrative act
- **West**: Spaniards, and allied Mexicas and Tlaxcaltecas in **Mexicaltzingo**
- **East** (1543): the conquered local population in **Analco** Nahuatl for “on the other side of the creek”

The three foundational settlements, 1542

Guadalajara, 1542: colonial status assigned by side of a creek

- Founded on unurbanized land, in one administrative act
- **West**: Spaniards, and allied Mexicas and Tlaxcaltecas in **Mexicaltzingo**
- **East** (1543): the conquered local population in **Analco** Nahuatl for “on the other side of the creek”
- Mexicaltzingo: “*not conquered, but among the conquerors*” (Castro Gutiérrez, 2010)
- Same authority, same legal regime the banks differed in colonial standing

The three foundational settlements, 1542

Guadalajara, 1542: colonial status assigned by side of a creek

The three foundational settlements, 1542

- Founded on unurbanized land, in one administrative act
- **West:** Spaniards, and allied Mexicas and Tlaxcaltecas in **Mexicaltzingo**
- **East** (1543): the conquered local population in **Analco** Nahuatl for “on the other side of the creek”
- Mexicaltzingo: “*not conquered, but among the conquerors*” (Castro Gutiérrez, 2010)
- Same authority, same legal regime the banks differed in colonial standing
- Historical natural experiment (Cantoni and Yuchtman, 2021)

No precolonial agglomerations

Same locational fundamentals

Same jurisdiction

Today: an avenue, one jurisdiction, no school catchments

Calzada Independencia, looking east

- Creek piped underground, 1903–1911 → Calzada Independencia
- Same municipality, courts, police, labor market
- No school catchments, no physical barrier
- 0.3% of residents speak an Indigenous language

From creek to avenue

Skin tone

1821 sorting

Today: an avenue, one jurisdiction, no school catchments

Calzada Independencia, looking east

- Creek piped underground, 1903–1911 → Calzada Independencia
- Same municipality, courts, police, labor market
- No school catchments, no physical barrier
- 0.3% of residents speak an Indigenous language
- The boundary survives in ordinary speech
de la Calzada para allá names the eastern bank (Reguillo, 1998)

The divide was already there in 1930

Census microdata: 1930 (*cuartel*), 1990 (tract), 2000–2020 (block, RDD)

The divide was already there in 1930

Census microdata: 1930 (*cuartel*), 1990 (tract), 2000–2020 (block, RDD)

1930: illiteracy **43%** east vs. **31%** west | attendance **27%** vs. **38%**
the gap remains visible in later census waves

Years of schooling

Literacy

1930 census

Exclusion and Persistent Neighborhood Differences

Named institutions stood on the west bank, 1800–1908

Four city maps: 1800, 1863, 1890, 1908 — georeferenced, each named entry assigned to a bank

Named institutions stood on the west bank, 1800–1908

Four city maps: 1800, 1863, 1890, 1908 — georeferenced, each named entry assigned to a bank

East: a third to two-fifths of the population, less than 15% of named institutions

Named institutions stood on the west bank, 1800–1908

Four city maps: 1800, 1863, 1890, 1908 — georeferenced, each named entry assigned to a bank

East: a third to two-fifths of the population, less than 15% of named institutions

No educational institution east of the creek until 1908

Neighborhood Orientation and Educational Demand

Framework: salience raises the weight on the neighborhood pull

Agent i in neighborhood ℓ chooses education $e_i \in \{0, 1\}$; type $\theta_i = 1$ weighs local social relations

$$U_i = w_0 + \underbrace{[\rho - C(P_\ell)]}_{\text{return net of cost}} e_i + \underbrace{a(s)}_{\text{salience weight}} \theta_i \left[\underbrace{\Gamma q_\ell (1 - \delta e_i)}_{\text{local ties}} - \underbrace{\kappa |e_i - \bar{e}_\ell|}_{\text{conformity}} \right]$$

q_ℓ : share of type-1 residents $\bar{e}_\ell$: local educational investment provision P_ℓ lowers the cost, $C'(P) < 0$

Framework: salience raises the weight on the neighborhood pull

Agent i in neighborhood ℓ chooses education $e_i \in \{0, 1\}$; type $\theta_i = 1$ weighs local social relations

$$U_i = w_0 + \underbrace{[\rho - C(P_\ell)]}_{\text{return net of cost}} e_i + \underbrace{a(s)}_{\text{salience weight}} \theta_i \left[\underbrace{\Gamma q_\ell (1 - \delta e_i)}_{\text{local ties}} - \underbrace{\kappa |e_i - \bar{e}_\ell|}_{\text{conformity}} \right]$$

q_ℓ : share of type-1 residents $\bar{e}_\ell$: local educational investment provision P_ℓ lowers the cost, $C'(P) < 0$

A type-1 agent invests if and only if

$$\rho - C(P_\ell) \geq a(s) \Pi_\ell, \quad \Pi_\ell \equiv \underbrace{\delta \Gamma q_\ell + \kappa (1 - 2\bar{e}_\ell)}_{\text{neighborhood pull}}$$

provision moves the left-hand side; salience moves the right-hand side

Framework: salience raises the weight on the neighborhood pull

Agent i in neighborhood ℓ chooses education $e_i \in \{0, 1\}$; type $\theta_i = 1$ weighs local social relations

$$U_i = w_0 + \underbrace{[\rho - C(P_\ell)]}_{\text{return net of cost}} e_i + \underbrace{a(s)}_{\text{salience weight}} \theta_i \left[\underbrace{\Gamma q_\ell (1 - \delta e_i)}_{\text{local ties}} - \underbrace{\kappa |e_i - \bar{e}_\ell|}_{\text{conformity}} \right]$$

q_ℓ : share of type-1 residents $\bar{e}_\ell$: local educational investment provision P_ℓ lowers the cost, $C'(P) < 0$

A type-1 agent invests if and only if

$$\rho - C(P_\ell) \geq a(s) \Pi_\ell, \quad \Pi_\ell \equiv \underbrace{\delta \Gamma q_\ell + \kappa (1 - 2\bar{e}_\ell)}_{\text{neighborhood pull}}$$

provision moves the left-hand side; salience moves the right-hand side

Making the neighborhood salient, $a(1) = a(0) + \Delta a$:

$$\Delta [U_i(1) - U_i(0)] = -\Delta a \Pi_\ell$$

Where the pull is positive, salience lowers educational demand

the experiment estimates this response; it does not identify Π_ℓ , q_ℓ , Γ , or κ

Educational regimes

- Turnover pulls composition toward the city average
- Provision converges; the local state need not
- Surnames stay distinct into the 20th century
- 1992 explosions: rebuilt blocks more schooled in 2000, gap gone by 2010

Educational regimes

1992 explosions

The 1992 explosions: a turnover shock whose schooling effect faded

Model: one-time turnover shock of size μ

$$q_{\ell,t+1} - q_{\ell,t} = (1 - \mu) \Phi_L(q_{\ell,t}) + \mu (\bar{q} - q_{\ell,t})$$

- New residents drawn from the city: q_{ℓ} falls, so $\bar{e}_{\ell} = 1 - q_{\ell}$ rises

start at $q^{\dagger}$; $\mu = 0.4$ (solid) or 0.8 (dashed); city share $\bar{q} = 0.2$; paper's illustrative parameters; periods are generations

The 1992 explosions: a turnover shock whose schooling effect faded

Model: one-time turnover shock of size μ

$$q_{\ell,t+1} - q_{\ell,t} = (1 - \mu) \Phi_L(q_{\ell,t}) + \mu (\bar{q} - q_{\ell,t})$$

start at $q^\dagger$; $\mu = 0.4$ (solid) or 0.8 (dashed); city share $\bar{q} = 0.2$; paper's illustrative parameters; periods are generations

- New residents drawn from the city: q_ℓ falls, so $\bar{e}_\ell = 1 - q_\ell$ rises
- Where the shock leaves q_ℓ decides the path
above q_c : the gap closes below q_c : it stays

The 1992 explosions: a turnover shock whose schooling effect faded

Model: one-time turnover shock of size μ

$$q_{\ell,t+1} - q_{\ell,t} = (1 - \mu) \Phi_L(q_{\ell,t}) + \mu (\bar{q} - q_{\ell,t})$$

start at q^+ ; $\mu = 0.4$ (solid) or 0.8 (dashed); city share $\bar{q} = 0.2$; paper's illustrative parameters; periods are generations

- New residents drawn from the city: q_ℓ falls, so $\bar{e}_\ell = 1 - q_\ell$ rises
- Where the shock leaves q_ℓ decides the path
above q_c : the gap closes below q_c : it stays

rebuilt vs. neighbor blocks in Analco: adult schooling; attendance given parents

Data: 1990 no difference; 2000 $\approx +1$ year and $+5$ pp; both gone by 2010

The 1992 explosions: a turnover shock whose schooling effect faded

Model: one-time turnover shock of size μ

$$q_{\ell,t+1} - q_{\ell,t} = (1 - \mu) \Phi_L(q_{\ell,t}) + \mu (\bar{q} - q_{\ell,t})$$

start at $q^{\dagger}$; $\mu = 0.4$ (solid) or 0.8 (dashed); city share $\bar{q} = 0.2$; paper's illustrative parameters; periods are generations

- New residents drawn from the city: q_{ℓ} falls, so $\bar{q}_{\ell} = 1 - q_{\ell}$ rises
- Where the shock leaves q_{ℓ} decides the path above q_c : the gap closes below q_c : it stays

rebuilt vs. neighbor blocks in Analco: adult schooling; attendance given parents

Data: 1990 no difference; 2000 $\approx +1$ year and $+5$ pp; both gone by 2010

The pattern matches a shock that left q_{ℓ} inside the basin of $q^{\dagger}$

also consistent with mean reversion or a housing cycle; the census follows places, not displaced families

Conclusion

Conclusion

- A 1542 exclusion still marks schooling and attendance, after public provision converged

Conclusion

- A 1542 exclusion still marks schooling and attendance, after public provision converged
- East of the boundary, social life is more oriented toward the neighborhood in 1821 names and in today's trust and associations

Conclusion

- A 1542 exclusion still marks schooling and attendance, after public provision converged
- East of the boundary, social life is more oriented toward the neighborhood in 1821 names and in today's trust and associations
- Making the neighborhood salient lowers educational demand there

Conclusion

- A 1542 exclusion still marks schooling and attendance, after public provision converged
- East of the boundary, social life is more oriented toward the neighborhood in 1821 names and in today's trust and associations
- Making the neighborhood salient lowers educational demand there
- Across places, more localized ties go with less schooling, more so under segregation

Conclusion

- A 1542 exclusion still marks schooling and attendance, after public provision converged
- East of the boundary, social life is more oriented toward the neighborhood in 1821 names and in today's trust and associations
- Making the neighborhood salient lowers educational demand there
- Across places, more localized ties go with less schooling, more so under segregation
- Policy
 - equalize provision first; then institutions that supply what the neighborhood pool supplies (Chetty et al., 2026)
 - caution with labels that designate places as problems (Andersson et al., 2026; Domínguez et al., 2025; Govind et al., 2025)

Conclusion

- A 1542 exclusion still marks schooling and attendance, after public provision converged
- East of the boundary, social life is more oriented toward the neighborhood in 1821 names and in today's trust and associations
- Making the neighborhood salient lowers educational demand there
- Across places, more localized ties go with less schooling, more so under segregation
- Policy
 - equalize provision first; then institutions that supply what the neighborhood pool supplies (Chetty et al., 2026)
 - caution with labels that designate places as problems (Andersson et al., 2026; Domínguez et al., 2025; Govind et al., 2025)

Material convergence need not close the social margin through which neighborhoods shape educational investment

Thanks!

Same jurisdiction on both banks

II.—JURIDICIÓN DE LA ZIUDAD DE GUADALAXARA ¹

Por el camino y rumbo que seguimos y avemos de llevar del noroeste, a 3 leguas del pueblo de Atotonilco, último de la jurisdicción de Ponzitlan, está el pueblo de San Martín que será de quatro a zinco Yndios, y adelante / como una legua el de San Pedro, y otra legua pequeña de la ziudad de Guadalajara y pueblo de Analco que está junto a las mismas cassas de la ziudad. Y en este camino dejamos al oriente y setentríon los pueblos de Tonalá, Tololotlan, San Gaspar, San Andrés y Guentitlan entre este camino y el Rrio Grande, en poco más de 4 leguas de distancia.

Y los pueblos de Tonalá, Tololotlan, San Martín, San Gaspar, San Andrés, son dotrinas de rreligiosos agustinos que residen en Tonalá.

Y San Pedro y Mexicalcingo y Tuluquilla y otros pueble-

1. Guadalajara, hoy capital del estado de Jalisco. Fué fundada primero en 1532 en la meta de Nochistlán por Juan de Cñate, comisionado por Nuño de Guzmán, luego trasladada a Tonalá (1533) y otra vez a Tlacotlán (cerca de la Barranca, 1535). Tuvo en fin su asiento definitivo en 1541, en el Valle de Atemaxac. Fué sede de la Audiencia Real de Nueva Galicia en 1550.

Pág. 51

- Both banks under the colonial authorities of Guadalajara and the Audiencia of New Galicia
(Lázaro de Arregui, 1946; Solís Matías, 1992)
- For most of the colonial period, neither Analco nor Mexicaltzingo held the autonomy of a *República de Indios*
- Around 1800 both are absent from the *propios y arbitrios* accounts: under the city's *ayuntamiento* (Tanck de Estrada, 1999)

Comprehension and use of the choice list

[Back: Design](#)

Leave-one-out

239 participants; min and max over the 239 re-estimations dropping one participant
enumerator and day FE, LASSO controls, Analco-by-distance terms

	Estimate	Leave-one-out range
<i>Panel A. Share of tutoring choices</i>		
Pooled effect (H1)	-0.077	[−0.090, −0.067]
Map-First × Analco (H2)	-0.267	[−0.297, −0.195]
Priming effect in Analco	-0.117	[−0.130, −0.103]
<i>Panel B. Willingness to pay (MXN pesos)</i>		
Pooled effect (H1)	-44.7	[−53.1, −38.5]
Map-First × Analco (H2)	-172.2	[−195.3, −127.8]
Priming effect in Analco	-70.9	[−78.0, −62.3]

[Back: Results](#)

Bounded willingness to pay

239 participants; controls as in the main table

two-sided p -values in parentheses, subject-level Bayesian bootstrap repeating both steps (1,000 replications)

	Pooled (H1)	Map-First × Analco (H2)	Effect in Analco
Latent scaled-probit WTP (two-step, main text)	−44.7 (0.146)	−172.2 (0.051)	−74.6 (0.025)
Area under demand (\$0–\$250, participant RE)	−18.4 (0.130)	−67.7 (0.047)	−30.2 (0.022)

The MXN 250 ceiling compresses the bounded measure; same sign, east-bank effect significant

[Back: Results](#)

Experimenter demand

“What do you think the study is about?” – 30 of 239 infer a neighborhood–education link interaction specification of the main table; HC1 SEs; significance by randomization inference within side

<i>Panel A. Robustness of the priming effect in Analco</i>			
	(1)	(2)	(3)
Share of tutoring choices [Map-First + Map-First×Analco]	−0.117** (0.052)	−0.124** (0.051)	−0.124** (0.056)
Willingness to pay, latent (pesos) [Map-First + Map-First×Analco]	−71.1** (33.9)	−75.3** (33.3)	−78.8** (36.6)
Willingness to pay, bounded area (pesos) [Map-First + Map-First×Analco]	−28.6** (13.6)	−30.6** (13.3)	−30.6** (14.7)
Guess-theme controls		✓	
Sample	All	All	Non-guessers
Participants	239	239	209
<i>Panel B. Effect of the treatment on the inferred topic (linear probability models)</i>			
	Map-First	Map-First × Analco	Dep. var. mean
Guessed mechanism	0.217 (0.102)	−0.224* (0.111)	0.126
Mentioned neighborhood	0.178 (0.139)	−0.131 (0.155)	0.360
Participants		239	

The inference rises on the west bank, where no effect appears; east-bank estimate unchanged
