Teaching Statement

L. Guillermo Woo-Mora

woomora.github.io

I have taught three complete courses, in English, as a sole lecturer at Paris Sciences et Lettres (PSL) University to mostly French-speaking bachelor students enrolled in the interdisciplinary *Sciences pour un monde durable (SMD)* and *Cycle Pluridisciplinaire d'Études Supérieures (CPES)* programs. The courses were introductory micro- and macroeconomics, with the CORE Econ textbooks (The CORE Team, 2024, 2017), and intermediate microeconomics, with Pindyck and Rubinfeld (2018). These courses are typically taught to around 20 to 30 students. Since 2022, I have been in charge of designing the syllabus, delivering the lectures, and designing the problem sets and exams for these courses. I have been teaching them in parallel with my PhD dissertation, and since 2024 as a half-time ATER (*attaché temporaire d'enseignement et de recherche*), a fixed-term teaching and research position in French universities.

Inspired by the CORE curriculum (Bowles and Carlin, 2020), my teaching aims at training students to address a real problem, select the most relevant economic tools to do so, test them on the data, and ultimately suggest a policy solution to the problem at hand. To that end, each topic is introduced with a real problem in mind, and discussed at the end in light of the available data. I aim at teaching students how to separate positive from normative statements, which enables them to hold informed discussions on actual economic policies, such as rent control or tariffs.

I want my classes to be participatory, so I do not allow laptops or tablets during lectures, a policy supported by experimental evidence that their use in class lowers students' exam performance (Carter et al., 2017). I also conduct simple experiments in class whenever possible, to test economic theories on my students themselves. Finally, I try my best to connect my classes to the latest research, including my own.

In these classes, I use various evaluation methods. Before the advent of LLMs, I used to ask students to write short essays on some of the topics of their choice. Students seemed to like this exercise, but I now prefer to focus on more in-class evaluation methods, and an exercise where students work in teams to write a policy brief, where they use the entirety of the course to suggest policy solutions to a specific and contextual problem. I discuss the different drafts with the students before they submit them.

Students seem to like my teaching methods. For instance, in 2022, 92% of the students who answered the evaluation of my intro micro course rated its content and evaluation methods as "excellent" or "good". Some of them specifically mentioned that they liked the games I conducted in class. More recently in 2025, students mentioned that they liked my clear explanations and the fact that I provide relevant examples from the real world (avocados, rent control in New York, etc.). They also asked me to slow down the pace of the course and provide more exercises to practice, which I now do during a part of each class.

Beyond good evaluations, I find it very rewarding to see some of my students, who are enrolled in non-economics programs, go on to pursue their studies in economics. At least three of them are now enrolled (or will be soon) in top French master's programs (at PSE, at the École polytechnique, etc.). I also try my best to facilitate their access to research experience, by helping them find research assistantships or internships with various professors, PhD students, and research centers.

I would be very happy to teach applied econometrics and other development/political economy/economic history courses (especially field courses) at the undergraduate or graduate level. I would also be very happy to continue teaching micro- and macroeconomics at the introductory or intermediate levels.
